For my website metrics analysis, I chose the following five columns: userID, # of page views, previous website, product type and itemID. M thought process through these metrics is to keep track of what items are being viewed and where they are being viewed from. As mentioned in focus 1, I am centering my e-business strategy around social media wit marketing and advertisement. That is why it is so important to know wl exactly the users are coming from. Which sites are customers seeing ou ads from? Is it ebay, amazon, cnn or our instagram post? What they are finding from each website is important as well, hence the metrics produ type and userID. This gives us a better understanding of what customer want from different types of sites and social media accounts. Perhaps amazon users are more intersted in books and coffee, while espn and m users are more interested in snacks and take-home products. This will h us to better cater our ads to specific site users with specific cafe produc Lastly, we also want to keep track of how many page views we are seei from each site as well, which tells us how we are doing on each site anc with each product/user. All in all, our metric system is built around advertisement and marketing finding where our users are coming from what they are interested in.
